Bedlift Hospital Bed Storage

Hospital beds need a proper home when they are not in use. And by proper home, we aren't referring to a secluded hallway down in the basement, or shoved to one side of a maintenance room. No, the proper home is the **Bedlift** – a vertical storage system for hospital beds. With the Bedlift, hospitals can now increase storage capacity and protection of their out-of-service hospital beds while satisfying JCAHO standards and avoiding potential fines.

The **Bedlift** offers an automated lift that accommodates most beds in the market. Three models provide a user to choose the height, thus the number of beds they can store in a column. Users can store 3, 4, or 5 beds in a footprint slightly larger than a single bed, recovering up to 70% of floor space.

Benefits of the Bedlift:

- » Inaccessible floor space is turned into usable square footage.
- » The **Bedlift** is automatic and easy to operate.
- » The beds are secure and protected, reducing the risk of damage.
- » The beds can be stored in a centralized area, cutting down on misplaced inventory
- » The lifts reduce fire hazards in hallways. Not only does the **Bedlift** make it safer for staff, but also eliminates the risk of JHACO penalties for improper hospital bed storage.

Let's face it; hospital beds are too valuable not to have a proper home when they aren't in use or when they are waiting on maintenance and repairs. The Bedlift is the answer.
